**Note 1:** V<sub>+</sub> and V<sub>-</sub> can have maximum magnitudes of 7V, but their absolute difference cannot exceed 13V.

**Note 2:** This device is constructed using a unique set of packaging techniques that impose a limit on the thermal profile the device can be exposed to during board-level solder attach and rework. This limit permits only the use of the solder profiles recommended in the industry-standard specification, JEDEC 020A, paragraph 7.6, Table 3 for IR/VPR and convection reflow. Preheating is required. Hand or wave soldering is not allowed.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

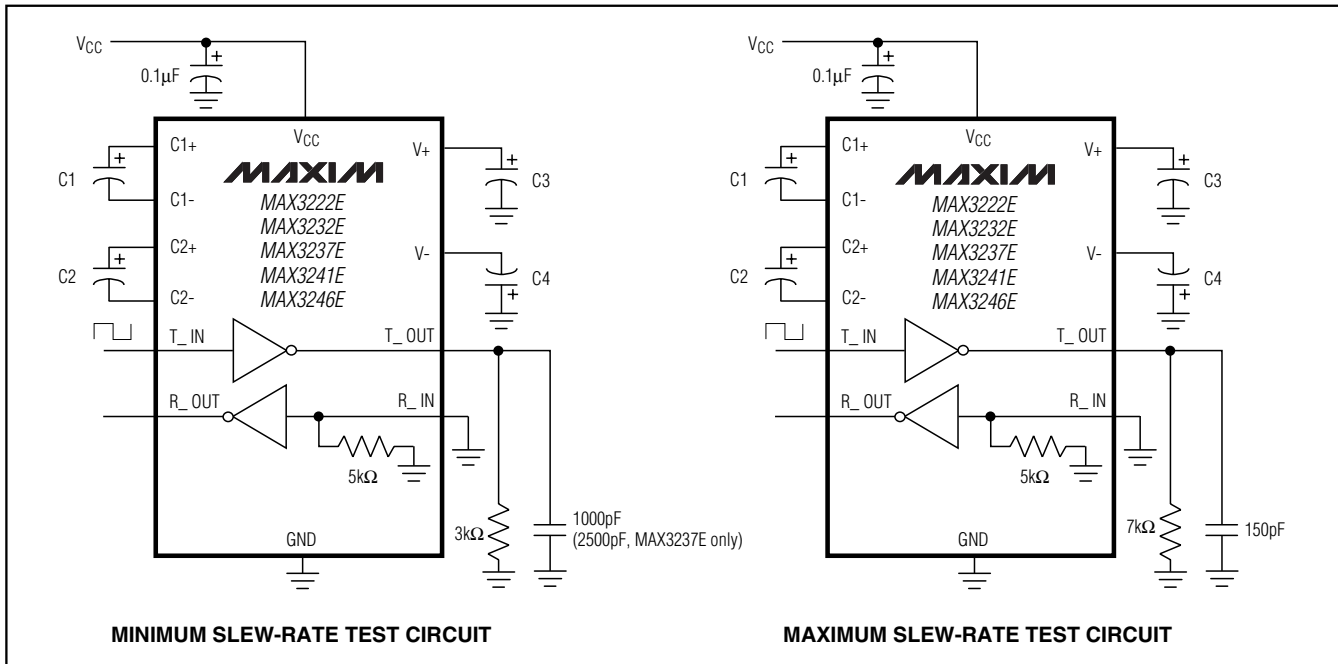

Figure 1. Slew-Rate Test Circuits

## Detailed Description

### Dual Charge-Pump Voltage Converter

The MAX3222E/MAX3232E/MAX3237E/MAX3241E/MAX3246Es' internal power supply consists of a regulated dual charge pump that provides output voltages of +5.5V (doubling charge pump) and -5.5V (inverting charge pump) over the +3.0V to +5.5V VCC range. The charge pump operates in discontinuous mode; if the output voltages are less than 5.5V, the charge pump is enabled, and if the output voltages exceed 5.5V, the charge pump is disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies (Figure 1).

### RS-232 Transmitters

The transmitters are inverting level translators that convert TTL/CMOS-logic levels to ±5V EIA/TIA-232-compliant levels.

The MAX3222E/MAX3232E/MAX3237E/MAX3241E/MAX3246E transmitters guarantee a 250kbps data rate with worst-case loads of 3kΩ in parallel with 1000pF, providing compatibility with PC-to-PC communication software (such as LapLink™). Transmitters can be paralleled to drive multiple receivers or mice.

The MAX3222E/MAX3237E/MAX3241E/MAX3246E transmitters are disabled and the outputs are forced

into a high-impedance state when the device is in shutdown mode (SHDN = GND). The MAX3222E/MAX3232E/MAX3237E/MAX3241E/MAX3246E permit the outputs to be driven up to ±12V in shutdown.

The MAX3222E/MAX3232E/MAX3241E/MAX3246E transmitter inputs do not have pullup resistors. Connect unused inputs to GND or VCC. The MAX3237E's transmitter inputs have a 400kΩ active positive-feedback resistor, allowing unused inputs to be left unconnected.

### MAX3237E MegaBaud Operation

For higher-speed serial communications, the MAX3237E features MegaBaud operation. In MegaBaud operating mode (MBAUD = VCC), the MAX3237E transmitters guarantee a 1Mbps data rate with worst-case loads of 3kΩ in parallel with 250pF for +3.0V < VCC < +4.5V. For +5V ±10% operation, the MAX3237E transmitters guarantee a 1Mbps data rate into worst-case loads of 3kΩ in parallel with 1000pF.

### RS-232 Receivers

The receivers convert RS-232 signals to CMOS-logic output levels. The MAX3222E/MAX3237E/MAX3241E/MAX3246E receivers have inverting three-state outputs. Drive EN high to place the receiver(s) into a high-impedance state. Receivers can be either active or inactive in shutdown (Table 1).

LapLink is a trademark of Traveling Software.

# **$\pm 15\text{kV}$ ESD-Protected, Down to 10nA, 3.0V to 5.5V, Up to 1Mbps, True RS-232 Transceivers**

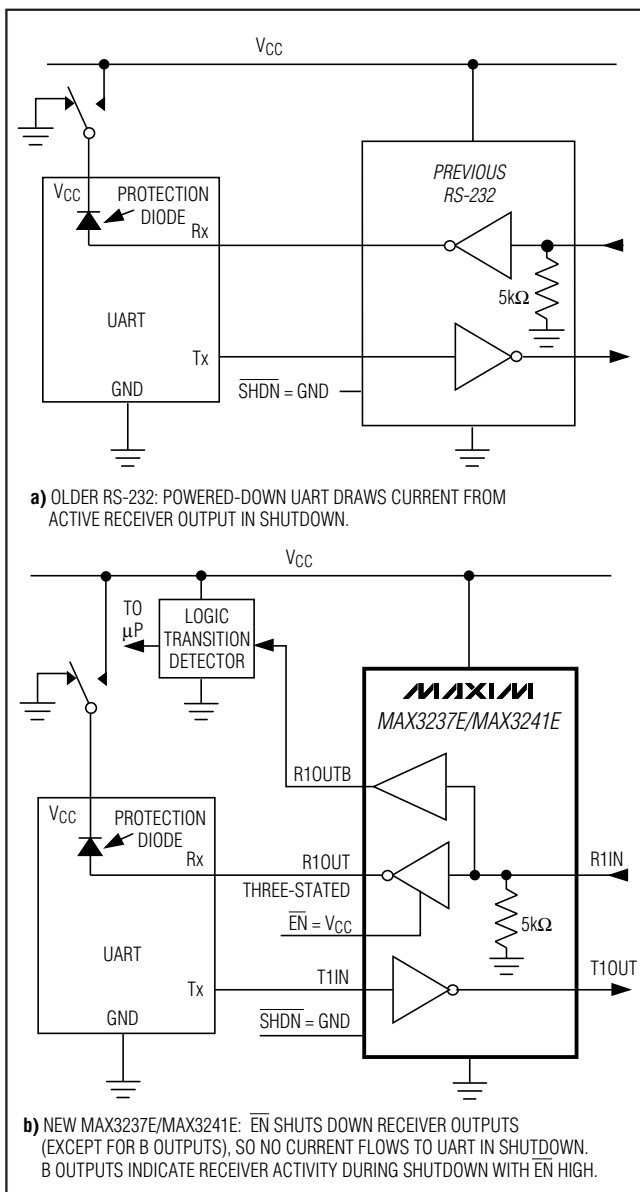

Figure 2. Detection of RS-232 Activity when the UART and Interface are Shut Down; Comparison of MAX3237E/MAX3241E (b) with Previous Transceivers (a)

The complementary outputs on the MAX3237E/MAX3241E (R\_OUTB) are always active, regardless of the state of  $\overline{\text{EN}}$  or SHDN. This allows the device to be used for ring indicator applications without forward biasing other devices connected to the receiver outputs. This is ideal for systems where VCC drops to zero in shutdown to accommodate peripherals such as UARTs (Figure 2).

Figure 3. Transmitter Outputs Recovering from Shutdown or Powering Up

## **MAX3222E/MAX3237E/MAX3241E/ MAX3246E Shutdown Mode**

Supply current falls to less than 1μA in shutdown mode (SHDN = low). The MAX3237E's supply current falls to 10nA (typ) when all receiver inputs are in the invalid range ( $-0.3\text{V} < \text{R\_IN} < +0.3\text{V}$ ). When shut down, the device's charge pumps are shut off, V+ is pulled down to VCC, V- is pulled to ground, and the transmitter outputs are disabled (high impedance). The time required to recover from shutdown is typically 100μs, as shown in Figure 3. Connect SHDN to VCC if shutdown mode is not used. SHDN has no effect on R\_OUT or R\_OUTB (MAX3237E/MAX3241E).

## **$\pm 15\text{kV}$ ESD Protection**

As with all Maxim devices, ESD-protection structures are incorporated to protect against electrostatic discharges encountered during handling and assembly. The driver outputs and receiver inputs of the MAX3222E/MAX3232E/MAX3237E/MAX3241E/MAX3246E have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of  $\pm 15\text{kV}$  without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, Maxim's E versions keep working without latchup, whereas competing RS-232 products can latch and must be powered down to remove latchup.

Furthermore, the MAX3237E logic I/O pins also have  $\pm 15\text{kV}$  ESD protection. Protecting the logic I/O pins to  $\pm 15\text{kV}$  makes the MAX3237E ideal for data cable applications.

# ±15kV ESD-Protected, Down to 10nA, 3.0V to 5.5V, Up to 1Mbps, True RS-232 Transceivers

**Table 1. MAX3222E/MAX3237E/MAX3241E/ MAX3246E Shutdown and Enable Control Truth Table**

$\overline{\text{SHDN}}$	$\overline{\text{EN}}$	T_OUT	R_OUT	R_OUTB (MAX3237E/ MAX3241E)
0	0	High-Z	Active	Active
0	1	High-Z	High-Z	Active
1	0	Active	Active	Active
1	1	Active	High-Z	Active

ESD protection can be tested in various ways; the transmitter outputs and receiver inputs for the MAX3222E/MAX3232E/MAX3241E/MAX3246E are characterized for protection to the following limits:

- ±15kV using the Human Body Model
- ±8kV using the Contact Discharge method specified in IEC 1000-4-2
- ±9kV (MAX3246E only) using the Contact Discharge method specified in IEC 1000-4-2
- ±15kV using the Air-Gap Discharge method specified in IEC 1000-4-2

3.3	3.3	Compatible with all CMOS families
5	5	Compatible with all TTL and CMOS families
5	3.3	Compatible with ACT and HCT CMOS, and with AC, HC, or CD4000 CMOS

For the MAX3237E, all logic and RS-232 I/O pins are characterized for protection to ±15kV per the Human Body Model.

## ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

## Human Body Model

Figure 4a shows the Human Body Model, and Figure 4b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

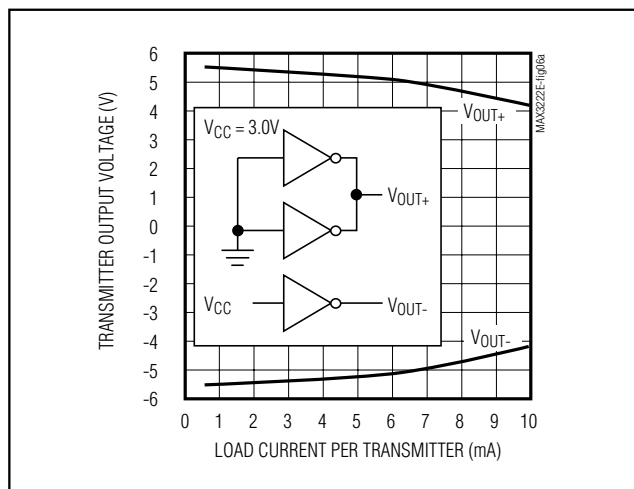

Figure 6a. MAX3241E Transmitter Output Voltage vs. Load Current Per Transmitter

## IEC 1000-4-2

The IEC 1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits. The MAX3222E/MAX3232E/MAX3237E/MAX3241E/MAX3246E help you design equipment that meets level 4 (the highest level) of IEC 1000-4-2, without the need for additional ESD-protection components.

The major difference between tests done using the Human Body Model and IEC 1000-4-2 is higher peak current in IEC 1000-4-2, because series resistance is lower in the IEC 1000-4-2 model. Hence, the ESD withstand voltage measured to IEC 1000-4-2 is generally lower than that measured using the Human Body Model. Figure 5a shows the IEC 1000-4-2 model, and Figure 5b shows the current waveform for the ±8kV IEC 1000-4-2 level 4 ESD Contact Discharge test. The Air-Gap Discharge test involves approaching the device with a charged probe. The Contact Discharge method connects the probe to the device before the probe is energized.

## Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. All pins require this protection during manufacturing, not just RS-232 inputs and outputs. Therefore, after PC board assembly, the Machine Model is less relevant to I/O ports.

MAX3222E/MAX3232E/MAX3237E/MAX3241E<sup>†</sup>/MAX3246E

## Capacitor Selection

When using the minimum required capacitor values, make sure the capacitor value does not degrade

## Power-Supply Decoupling

### Operation Down to 2.7V

Transmitter outputs meet EIA/TIA-562 levels of  $\pm 3.7V$  with supply voltages as low as 2.7V.

# ±15kV ESD-Protected, Down to 10nA, 3.0V to 5.5V, Up to 1Mbps, True RS-232 Transceivers

## Transmitter Outputs Recovering from Shutdown

Figure 3 shows two transmitter outputs recovering from shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels (one transmitter input is high; the other is low). Each transmitter is loaded with 3kΩ in parallel with 2500pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that

the transmitters are enabled only when the magnitude of V<sub>-</sub> exceeds approximately -3.0V.

## Mouse Drivability

The MAX3241E is designed to power serial mice while operating from low-voltage power supplies. It has been tested with leading mouse brands from manufacturers such as Microsoft and Logitech. The MAX3241E successfully drove all serial mice tested and met their current and voltage requirements.

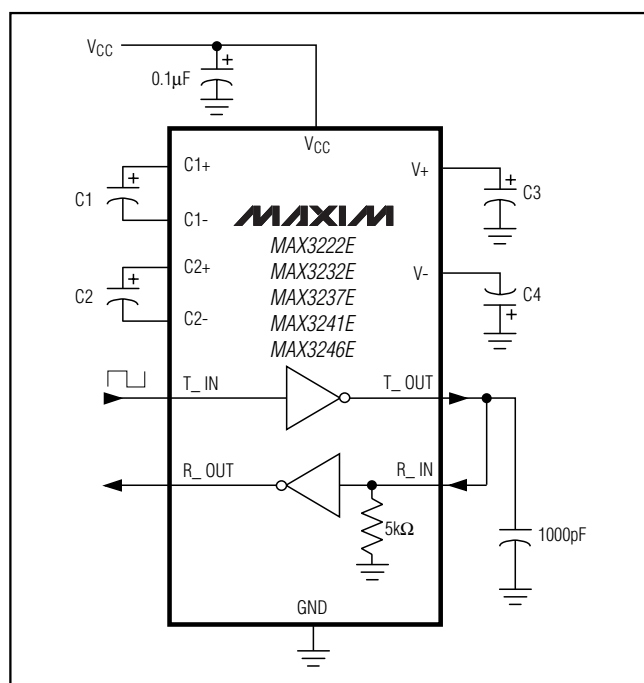

Figure 7. Loopback Test Circuit

Figure 8. MAX3241E Loopback Test Result at 120kbps

Figure 9. MAX3241E Loopback Test Result at 250kbps

Figure 10. MAX3237E Loopback Test Result at 1000kbps (MBAUD = VCC)

## **$\pm 15\text{kV}$ ESD-Protected, Down to 10nA, 3.0V to 5.5V, Up to 1Mbps, True RS-232 Transceivers**

Figure 6a shows the transmitter output voltages under increasing load current at +3.0V. Figure 6b shows a typical mouse connection using the MAX3241E.

### **High Data Rates**

The MAX3222E/MAX3232E/MAX3237E/MAX3241E/MAX3246E maintain the RS-232  $\pm 5\text{V}$  minimum transmitter output voltage even at high data rates. Figure 7 shows a transmitter loopback test circuit. Figure 8 shows a loopback test result at 120kbps, and Figure 9 shows the same test at 250kbps. For Figure 8, all transmitters were driven simultaneously at 120kbps into RS-232 loads in parallel with 1000pF. For Figure 9, a single transmitter was driven at 250kbps, and all transmitters were loaded with an RS-232 receiver in parallel with 1000pF.

The MAX3237E maintains the RS-232  $\pm 5.0\text{V}$  minimum transmitter output voltage at data rates up to 1Mbps. Figure 10 shows a loopback test result at 1Mbps with  $\text{MBAUD} = \text{V}_{\text{CC}}$ . For Figure 10, all transmitters were loaded with an RS-232 receiver in parallel with 250pF.

### **Interconnection with 3V and 5V Logic**

The MAX3222E/MAX3232E/MAX3237E/MAX3241E/MAX3246E can directly interface with various 5V logic families, including ACT and HCT CMOS. See Table 3 for more information on possible combinations of interconnections.

### **UCSP Reliability**

The UCSP represents a unique packaging form factor that may not perform equally to a packaged product through traditional mechanical reliability tests. UCSP reliability is integrally linked to the user's assembly methods, circuit board material, and usage environment. The user should closely review these areas when considering use of a UCSP package. Performance through Operating Life Test and Moisture Resistance remains uncompromised as the wafer-fabrication process primarily determines it.

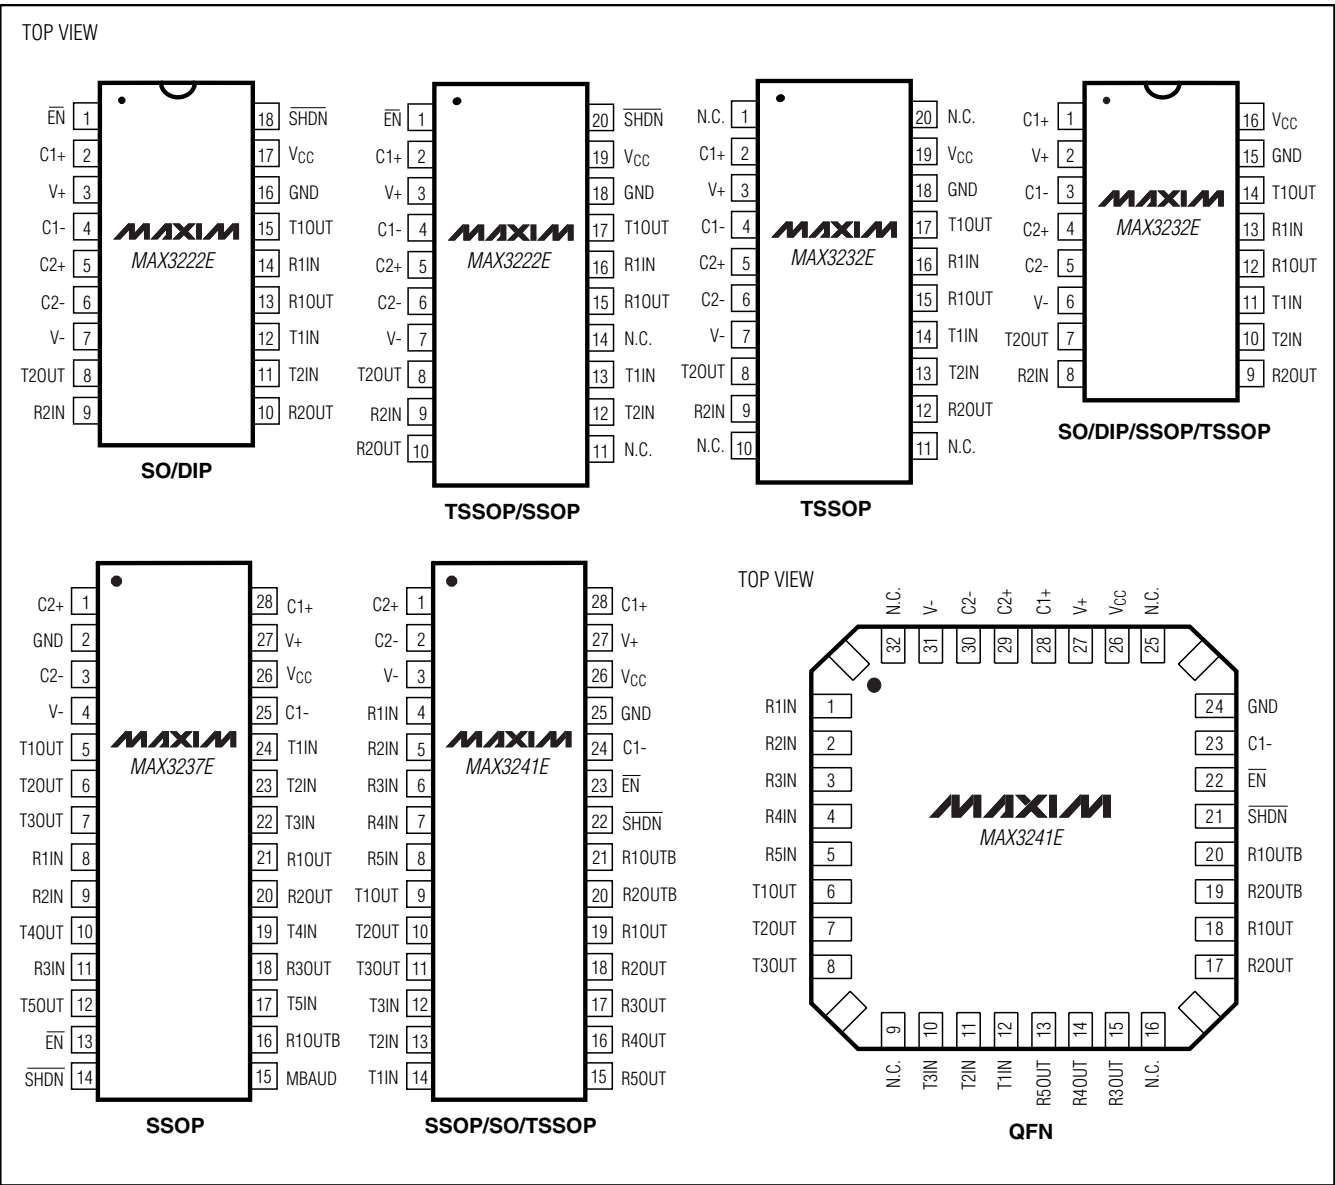

Mechanical stress performance is a greater consideration for a UCSP package. UCSPs are attached through direct solder contact to the user's PC board, foregoing the inherent stress relief of a packaged product lead frame. Solder joint contact integrity must be considered. Table 4 shows the testing done to characterize the UCSP reliability performance. In conclusion, the UCSP is capable of performing reliably through environmental stresses as indicated by the results in the table. Additional usage data and recommendations are detailed in the UCSP application note, which can be found on Maxim's website at [www.maxim-ic.com](http://www.maxim-ic.com).

**Table 4. Reliability Test Data**

TEST	CONDITIONS	DURATION	FAILURES PER SAMPLE SIZE
Temperature Cycle	$T_A = -35^\circ\text{C}$ to $+85^\circ\text{C}$ , $T_A = -40^\circ\text{C}$ to $+100^\circ\text{C}$	150 cycles, 900 cycles	0/10, 0/200
Operating Life	$T_A = +70^\circ\text{C}$	240 hours	0/10
Moisture Resistance	$T_A = +20^\circ\text{C}$ to $+60^\circ\text{C}$ , 90% RH	240 hours	0/10
Low-Temperature Storage	$T_A = -20^\circ\text{C}$	240 hours	0/10
Low-Temperature Operational	$T_A = -10^\circ\text{C}$	24 hours	0/10
Solderability	8-hour steam age	—	0/15
ESD	$\pm 15\text{kV}$ , Human Body Model	—	0/5
High-Temperature Operating Life	$T_J = +150^\circ\text{C}$	168 hours	0/45

**$\pm 15\text{kV}$  ESD-Protected, Down to 10nA, 3.0V to 5.5V,  
Up to 1Mbps, True RS-232 Transceivers**

**Pin Configurations**

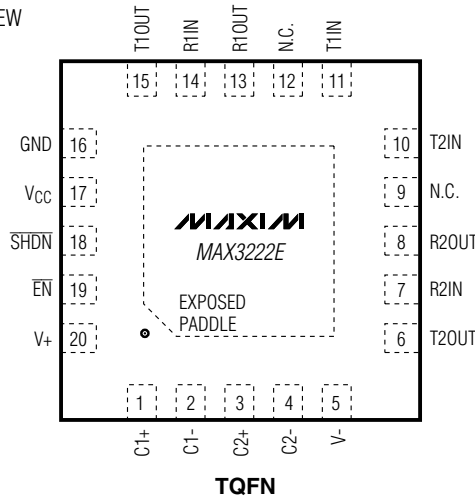

# **$\pm 15\text{kV}$ ESD-Protected, Down to 10nA, 3.0V to 5.5V, Up to 1Mbps, True RS-232 Transceivers**
